

Quality, environmental, data protection and information policy

The strategic quality, environmental, data protection and information security policy forms the framework for transparent, sustainable, process-based and risk-oriented management and control of the company as part of an Integrated Management System (IMS).

This policy and the corporate guidelines integrally linked to it form the basis for creating a uniform awareness of quality, environmental management, information security and data protection as well as risk management and legal compliance for all employees and ensure a minimum standard for risk-appropriate and economically reasonable measures. To protect the environment, we are committed to preventing unnecessary environmental pollution as far as possible, continuously reducing our environmental impact and thus creating a basis for targeted business activities and the continuous improvement and optimization of resource consumption and emission levels, and fulfilling our responsibility towards the various stakeholders in order to meet the expectations and requirements, as well as other technical, economic and scheduling agreements from the contracts in the best possible way. In this way, we optimize the conditions for the satisfaction and security of customers,

partners and employees, as well as long-term economic success.

We provide our products and services to our customers at an economically reasonable price, in the agreed quality and scope, in an environmentally conscious manner and with the highest possible level of information security in compliance with the law. We undertake to ensure compliance with and fulfillment of binding obligations in the areas of environmental protection, quality and information security and to always align our business activities with the applicable laws and standards. The management considers it its duty to ensure that the protection of personal data and the contractual conditions agreed between affiliated companies and their customers are complied with.

The management promotes awareness of responsibility, quality, environmental, information security and risk among employees and regulates the responsibilities and procedures for all activities.

All activities follow a process-based and risk-oriented approach; they are continuously reviewed for appropriateness and risk characteristics and controlled through measures. With this in mind, we are committed to continuously improving the management system.
